How to maintain the quality of a journal?

Ching-Wan Lam

Clinical Professor, Department of Pathology, The University of Hong Kong

Publication of your manuscripts in a scientific journal is the most effective way of disseminating your research work with peers of your field. The Editors of the journal aim to accrue papers with clinical impact in the clinical laboratory science so that readers, authors, and journals will all benefit. After the authors submitted the manuscript to a journal, the manuscript will be sent to reviewers for peer-review. The editors will decide whether the paper will be rejected, accepted, or have to be revised and reviewed before acceptance for final publication based on the reviewer comments. The quality of a journal will depend on how good this process is executed, the turn-around-time of the reviewing process, and how long will the papers published on the Journal website after acceptance. The success of a scientific journal will depend on a concerted effort by authors, reviewers, the editorial board and editors, and publishers.
